CAPABILITY BRIEF · IN DEVELOPMENT

Train for the task. Measure readiness.

Physical AI training data and robotics evaluation. Metari is developing instrumented environments for expert-led training data and repeatable robotics evaluation, and is seeking program and industry partners in facilities, logistics, maintenance and infrastructure operations.

Every program answers three questions first: what task the robot must perform, how it will be evaluated, and what evidence the customer receives.

Concept visualization. Proposed environment.

Status: Campus 01 is planned, not operating. Command Center is a prototype with simulated records. All example scenarios and results are illustrative.

Proposed offerings

01

Mission-specific training data

Expert demonstrations and customer-specified sensor capture, organized around defined tasks, quality checks and delivery formats.

Robot readiness evaluation

Repeatable physical scenarios with agreed metrics, documented interventions, failure review and evidence for deployment decisions.

Dedicated program capacity

Future configured space, instrumentation and operating support under an agreed scope, subject to launch conditions.

Proposed programs. Scope, equipment, personnel, rights, pricing and availability are agreed before delivery.

Initial task domains

02

FACILITY OPERATIONS

- Cart preparation
- Supply replenishment
- Linen handling, room reset

LOGISTICS AND MATERIAL MOVEMENT

- Tote transfers
- Shelf access, sorting
- Doorway navigation

MAINTENANCE AND SKILLED TRADES

- Tool selection
- Work-area preparation
- Training equipment only

INSPECTION · PARTNER-LED EXPANSION

- Nonhazardous mock-ups
- Confined-access corridors
- Qualified partner platforms

Platform neutral: humanoids, mobile manipulators, arms or inspection platforms, depending on the program. No manufacturer participation is implied.

Images are concept visualizations. No Metari facility is operating. No government program, contract, award or endorsement exists.

Proposed deliverables

03

Program specification

Tasks, environments, variations, sensor configuration and acceptance criteria.

Training dataset

Accepted recordings, agreed annotations, calibration and sync metadata, delivery manifest.

Evaluation report

Trial conditions, outcomes, interventions, limitations and failure analysis, on held-out configurations.

Evidence index

Links each requirement to episodes, tests, reviewer decisions and artifacts.

Deliverable formats are agreed per program. No customer deliverable exists yet. Illustrative example programs are on metari.io/gov.

Engagement path

04

01
Define the requirement
Tasks, environment, conditions and evidence needed.

02
Agree scope and conditions
Equipment, personnel, rights, acceptance criteria.

03
Establish the agreement
Services agreement, paid work package or teaming.

04
Launch when ready
Work starts once readiness conditions are met.

ROBOTICS COMPANIES, PRIMES AND PARTNERS

A conditional teaming agreement or a meaningful non-binding LOI naming the intended work and launch dependencies.

AGENCIES AND LABORATORY TEAMS

A technical conversation about the requirement and an appropriate procurement path. No commitment needed to talk.

Readiness and governance

05

PROTOTYPE
Command Center
Simulated records

CONTINGENT
Delivery
On launch requirements

To be agreed and implemented per program, not audited controls in operation today:

- ☐ Data rights and licensing
- ☐ Consent for every expert and participant
- ☐ Access controls
- ☐ Customer-data separation
- ☐ Retention and deletion
- ☐ Evaluation integrity and held-out sets

No security authorizations, certifications, clearances, registrations or contract vehicles are held today; sensitive work needs a separately assessed scope. NVIDIA Inception membership is not an endorsement, investment or government approval.

What does your program need a robot to do?

Tell us the task, the environment and the evidence you need.

Do not send classified information, controlled unclassified information, protected health information, credentials or sensitive operational details by email or web form.
